## ASSIGNMENT Complete a diploma project

Student Asim Poya

Topic: «College building with the use of kinematic supports in Almaty»

Approved by the Order of the Rector of the University No. 2131-b dated November 24, 2020.

The deadline for the completed work is May 10, 2020.

Initial data for the diploma project: construction area in Almaty

Structural schemes of the building - frame-wall with cross-beams, structures are made of monolithic reinforced concrete, architectural solution.

List of questions to be developed:

a) Architectural and analytical part: basic initial data, space-planning solutions, heat engineering calculation of enclosing structures (outer wall), lighting calculation, calculation of the foundation option and depth of laying, justification of energy efficiency measures;

b) Calculation and design part: calculation and design of a column and slab;

c) Organizational and technological part: development of technological maps, construction schedule and construction plan;

d) Economic part: local estimate, object estimate, summary estimate;

List of graphic material (with exact indication of required drawings):

1 Facade, standard floor plans, parts 1-1 and 2-2 - 4 sheets;

2 KZh columns, specifications - 1 sheet;

3 Technical maps of reinforcing bar works, calendar plan, construction site plan - 4 sheets.

11 slides of work presentation are provided.

Recommended main literature:

1 SP RK 2.04-01-2017 "Construction climatology";
2 SN RK 2.04-04-2013 "Construction heat engineering", SN RK 2.03-30-2017 "Construction in seismic zones".

### АҢДАТПА

Университеттердің құрылысы білім беруде, зерттеулерде және технологияларда маңызды рөл атқарады. Бұл жоба төрт негізгі бөлімнен тұрады

1) Сәулет ережелері бойынша айырмашылықтары мен шешімдері бар төрт айырмашылық жоспары бар сәулет бөлігі

2 ETABS инженерлік бағдарламасымен есептелетін жобалау бөлігі және стандарттарға немесе ғимараттың орналасуына қатысты таңдалған материалдарға қатысты негізгі жүктемелер.

3. Ғимаратта салу тәсілін көрсететін технологиялық бөліктер.

4. Құрылыстың құнын анықтайтын сметалық бөлігі.

### АННОТАЦИЯ

Строительство университетов играет важную роль в образовании, исследованиях и технологиях. Этот проект состоит из четырех основных частей.

1. Архитектурная часть, состоящая из четырех разностных планов с разностными площадями и решениями в соответствии с архитектурными правилами.

2. Расчетная часть, которая рассчитывается инженерной программой ETABS, и основные нагрузки на материалы, которые уже были выбраны с учетом стандартов или местоположения здания.

3. Технологические части, которые покажут способ постройки в здании.

4. Сметная часть, определяющая стоимость здания.

#### ANNOTATION

Build of the Universities play an important role in education, research and technology. This project has four main parts

1. The architectural part which contains of four difference plan with difference area and solution regarding to architectural rules

2. Design part which is calculate it by the ETABS engineering program and the basic loads regarding the materials which were chosen already regarding standards or building location.

3. Technological parts which going to show the way of constructing in the building.

4. The estimated part which is define the building cost.

#### **INTRODUCTION**

The goal of university education has always been the creation, transfer and implementation of knowledge. Knowledge in its current form is at the heart of the processes shaping modern society; today higher education and research are key elements of sustainable biological development of culture, social economy, individuals, societies and countries.

And building of the Universities play an important role in education and training, education, research and technology. In the field of education, universities provide specific training for high-level study and training necessary for personal development. The role of the university is crucial for all disciplines, both social and legal. Graduates of all disciplines also need knowledge of sustainable development. Universities gain the new knowledge and skills needed to address sustainable development issues in society, raise awareness, make informed decisions, provide conditions for responsible behavior and consumer choice. Universities are considered as important institutions in the process of social change and development. The most important task assigned to them is the training and research results of highly qualified personnel in order to achieve the determined goals. Another role that universities can play is the creation of new institutions in civil society, the development of new cultural values, and the formation and socialization of people in a new social era. This document focuses not only on a legal perspective, but also on the role of universities in promoting economic, political, social and cultural change in society. It also describes the impact of education on social change.

The project is going to build in the Almaty, Kazakhstan (st.Gabdullin, 5). The project is kind of university about nine floors, Aside of its population, Almaty has the wonderful climate.

## **1** Architectural Part

### **1.1 Architectural planning solution**

The exact configuration starts with measuring the basic (overall) dimensions of the components of the structure of the frame. Vertical dimensions are fixed on the base. The horizontal part is related to the length of the building.

The collapsed remnants of the transitional frame are very intact and firmly attached to the central pillars. And the slabs going to be design as there supports. And in Display properties include position selection between frame and column, orientation of main tree, etc. Contains. These factors include construction objectives, design and design decisions, technical and economic drawings, etc.

The college going to build in Almaty Kazakhstan, the average temperature of Almaty city is 10*Celsius* with the 1.1m/s average wind speed.

As it's a college building and in the partition should be considered standard of architecture like from universities or colleges standards.

The outside wall of the building is with the width of 0.35m and the inner walls are with the 0.25m (brick masonry wall), the floors thickness is 20cm according the required code for buildings.

And the column size are (45x60), (45\*55), (45\*45), (35\*50). From the first up to third floor is with the cross section area of 45\*60, from fourth to five 45\*55, and others 45\*45 and the last story is 35\*50.

The architecture reference instruction take out from the <u>Kazakhstan national</u> code 3.02-10-2011

#### Lecture hall chairs

A combination of folding and swivel chairs, chairs with a backrest and a table (with a hook for hanging a box (frame) or bag) are often fixed. The order of placement varies from style to style based on people, number of students and type of education (slide show facilities and electronic audio facilities). Some lecture halls (mathematic, chemistry and physics) have sloping chair rows, the space required for each student depends on the type of chair, the depth of the desk and the slope of the floor. The required space for each student is equal to  $1.10 m^2$ in small halls and in normal conditions  $0.8-0.95 m^2$  includes all the moving spaces in larger lecture halls in a cramped position.

## Projections, boards, sound features, projection screen brightness

Black-and-white boards can be placed on separate surfaces or fixed directly on the wall. Wall panels in multiple pieces, often moving vertically, manually or mechanically, can be pulled down to the projection range. It is also possible to use wheeled boards or monitors. The sound of the speech should be as uniform as possible without any disturbance such as the return of the sound to the listener. Suspended ceilings help reflect and absorb sound. The back walls should be covered with soundabsorbing materials and the other walls should remain as simple as possible.

Seminar rooms and design services Lecture halls and seminar rooms must comply with executive regulations. Wheelchair users should ensure that there is adequate space in the lecture hall in accordance with the standards.

Lecture Room Service Rooms Each lecture hall should have a side room with direct access. These rooms do not have a fixed use and can be used as storage. Sufficient space for ceremonies should be located next to all lecture halls for experiments at the same level and lead to a short path to the balcony. Instructions for the minimum size of a rectangular lecture hall is about 0.25-0.2 m per person and for trapezoidal plans 0.18 m - 15.5 m per person and in natural science halls per clinical sample. 0.3m - 0.2 per person The space required for storage and staff rooms is essential for the proper functioning of lecture halls A room for technical staff to store equipment, a room for laundry staff, a storage room for Interchangeable components such as lamps, bulbs and moonlights, blackboards and clothes, the minimum size of each room is 15m and the total space required for the side rooms is at least equal - 50-60m

### Computer rooms

Computer rooms depends on the number and size of the computer desk also the size of transformer display

General educational rooms

Seminar rooms have a normal size of 20,40,50,60 chairs, have double movable desks with a length of 1,2m, a depth of 0.6 m and the space required for each student is 1.9-2m. How to arrange the tables for training and group work is different. If free ventilation is provided through an external wall, the depth of the room should not exceed the exact ceiling height of 2.5m.

Office science members

Teacher rooms dimension  $20-24m^2$ 

Scientific Assistance rooms dimension  $15m^2$ 

Assistance rooms dimension  $20m^2$ 

Secretary rooms dimension 15 (for two =  $20 m^2$ )

Dressing rooms and toilets

At least it should be consider (0.15-0.16)  $m^2$  per seat

Library

Library with free Access It is possible to store 20,000 to 30,000 volumes of books freely on the shelves.

#### Book storage

Bookcase with 6-7 shelves has a height of 2m (accessible height) the distance between the bookshelves is 1.6-1.5 m. The required space is 1-1.2 m per 200 volumes of books.

Study area in library

With the width (0.9-1) m depth , 0.8m required space to

(2.4 - 2.5) m per checkpoint at the entrance with storage of books and packages, catalogs, Copy room.

### **1.2 Decision of general plan**

The land allocated for the construction of a college for education in Almaty city in the newly developed area of the city and on the construction site will be built.

The area is free from the construction of utilities the construction site is characterized by the following data and values:

- Not flooded by floods and other surface waters;

- Prevailing wind-east.

Transport services are provided by existing roads. The building is surrounded by hard pavements.

The dimensions of the elements of the master plan include utilities, roads, taking into account the placement of sidewalks, landscaping elements, as well as in accordance with sanitary and fire safety norms and regulations.

0.2 m thick for restoration before construction. It is planned to remove the vegetation layer. Orientation of the premises meets the standards.

## **1.3 Constructive solution**

The college going to build in Almaty Kazakhstan, the average temperature of Almaty city is 10°C with the 1.1m/s average wind speed.

Constructive solutions

Monolithic reinforced concrete frame for the frame of the building in construction applied.

The lifting structures of the building are designed of monolithic reinforced concrete.

The frame scheme - frame system was accepted as the design scheme of the building.

Structural strength and stability of the building, joint operation of beams. Column pitch -the variable varies according to the architectural solution.

The cross section of the columns was taken differently in height and section:

This project is a monolith made of C30 / 37 class concrete, slab contraction joints should intersect at the openings for columns. Frame dimensions of the cross section of the elements: made of concrete of class C30/ 37crossba 450x60), (450, 550) (450, 450) (450

(450x550), (450 x500), (450x450) mm (bxh), the height of the cross section of the columns variable.

Slab contraction joints should intersect at the openings for columns 200 mm and 200 mm reinforced concrete.

Stairs made of monolithic reinforced concrete.

Place for reinforcement, S500 class hot-rolled steel fittings according to 5781-82 applied. Enclosure construction on standard floors 75 marks made of heat block (200mm).

The partitions are also made of brick around the building made of 80 mm thick concrete with a width of 1000 mm, sand base with a thickness of 100 mm, impregnating two layer bitumen until complete saturation the floor is installed.

Reinforced concrete elements in contact with the soil 2 times with hot bitumen should be lubricated.

Floors:

1) in the playground and administrative rooms – parquet;

2) Sanitary facilities and bathrooms have ceramic tiles;

3) in vestibules, elevator halls, main entrance vestibule-granite tiles;

4) Stair railings, loggias, electrical panels and garbage collection.

In the chambers - ceramic tiles.

Doors are decorated with valuable species of wood. Built-in cabinets and mezzanines are covered with plywood and knife painted twice with clear matte varnish.

## 2 Structural part

## 2.1 basic loads calculation

For calculation of deal load of building we need to have the thickness of slabs and the material density that we are going use in our building .We calculate load in tabular form table 2.1

Table 1 - Collecting of loads In the Appendix B

## 2.1.1 Live loads of building

For calculation in programs we need to take them out from the codes

| Categories of | Specific use                      | Example               |
|---------------|-----------------------------------|-----------------------|
| use           |                                   |                       |
| Category      |                                   |                       |
| А             | Area for domestic and residential | Residential buildings |
|               | activities                        |                       |
| В             | Office area                       |                       |
| С             | Areas where people may Cong       | University, college,  |
|               | rate                              | coffee etc            |
| D             | Shopping areas                    | Markets               |

| Table 2 I  | ive | loads | category |
|------------|-----|-------|----------|
| 1 auto 2 1 |     | ioaus | category |

My buildings in category C (C1) so we choose load from the table 2.3 which is equal to 2KN

|-----|------------|------------------|
| -D2 | 4.0 to 5.0 | 3.5 to 7.0       |

#### **2.1.2 Calculation of Snow Load**

For the determining snow load we need to know the our area zone so it's on II category

$$\mathbf{S} = \boldsymbol{\mu}_{\mathbf{i}} \cdot \mathbf{C}_{\mathbf{e}} \cdot \mathbf{C}_{\mathbf{t}} \cdot \mathbf{S}_{\mathbf{k}} \tag{1}$$

where  $S_{K}$ - calculation value of the extreme snow load on the ground =0.8KPa;

Ce- the environmental coefficient or exposure factor if protected =1.2Regarding to the zone ;

 $C_t$ - the temperature coefficient if heated = 1;

 $\mu_i$ - coefficient of snow load form for general buildings=1.

 $S = 1 \cdot 1.2 \cdot 1 \cdot 0.8 = 1 \text{ KPa}$ 

The combination of effects of actions to be considered should be based on

- The design value of the leading variable action, and

- The design combination values of accompanying variable actions We can have the following formula [6]:

 $\sum \gamma_{G,\,JGK,J} + \gamma_P P + \gamma_{Q,1} Q_{K,1} + \sum \gamma_{Q,i} \psi_{0,i} Q_{k,i}$ 

Where for permanent ( $\gamma_{G,I}$ ) we have 1.35 for variable(floor  $\gamma_{Q,1}$ ) we have 1.5 and for  $\gamma_{Q,I}$  we have 1.5.0.5=0.75.

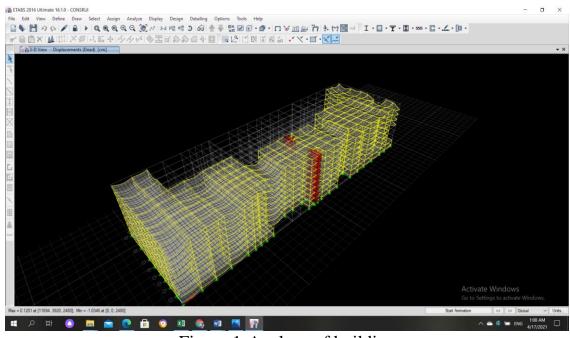

Figure 1-Analyse of building

More explanation on the application 2

#### 2.2 Design of rectangular slab

Estimated span. The one end support is cantilever, simply support and other end is connected  $T_o$  establish the design span, the slabs are preset by the dimensions of the crossbar according to the formula 2 [1]:

$$h_p = \left(\frac{1}{18}\right) \cdot l_1 \tag{2}$$

where  $l_1$  – column spacing, cm.

$$h_p = (\frac{1}{18}) \cdot 940 = 52 \text{ cm}$$

According to the unification requirement, we can't take it less than 55cm so we take the crossbar height 55cm.

Preliminary beam width according to formula 3 [1]:

$$b = (0.3 - 0.4) \cdot h_p \tag{3}$$

where  $h_p$  – cross-sectional height of the girder, cm

$$b = 55 \cdot 0.4 = 22 \text{ cm}$$

According to the unification requirement and considering more safety requirements we take the crossbar with the width of 35 cm.

$$l_0 = l_2 - \frac{b}{2},$$
 (4)

where 
$$l_2$$
 – span of the building, cm;

b – Cross-sectional width of the crossbar, cm

$$l_0 = 8.4 - \frac{0.35}{2} = 8.2 \text{ M}$$

Collection of loads. Calculation of loads per 1  $m^2$  of flooring is given in accordance with table 2.1.

Design load per 1 m with a slab width of 0.2 m, taking into account the safety factor for the purpose of the building  $\gamma_n = 0.95$ :

Constant  $g=2 \cdot 0.2 \cdot 0.95=3.5$  KN /M;

Complete  $g+v = (1.2 \cdot 2.0) \cdot 0.95 = 5.49 \text{ kN} /\text{M}; v=1.2 \cdot 2.0 \cdot 0.95 = 2.28 \text{kN} /\text{M}.$ Including permanent and long-term  $6.49 \cdot 2 \cdot 0.95 = 12.33 \text{ kN} /\text{M}$ 

#### 2.2.1 Efforts from design and standard loads

The bending moment of the design load is determined by the Etabs program we choose from there for calculating other values.

#### M == 52 kN/m

The shear forces also chosen from the Etabs results .

Q = 17.5 kN

From standard full load:

From standard constant and long-term loads:

#### 2.2.2 Determining the dimensions of the slab section

The height of the section of a hollow-core (10 round voids with a diameter of 15 cm) slab according to the 7 [1]:

$$h = \frac{l_0}{30} \tag{7}$$

where  $l_0$  - calculated span;

 $h = \frac{820}{30} \approx 26 \text{ cm}$ 

The working height of the section is determined by the formula [1]:

$$h_0 = h - c_1 \tag{8}$$

where h – section height  $c_1$  - protective layer

$$h_0 = 26 - 3 + 3 = 20 \text{ cm}$$

Dimensions: thickness of the upper and lower shelves 3 cm. Width of ribs: medium-4 cm, extreme ribs - 5 cm.In calculations for the limiting states of the first group, the calculated thickness of the compressed T-section flange  $h_f'=3$  cm; attitude  $h_f'/h=3/26=0.11>0.1$ , in this case, the entire width of the shelf is taken into account  $b_f'=200$  cm; design rib width  $b=\frac{840}{20}=42$  cm. Should not be less then 55cm

Strength characteristics of concrete and reinforcement. Restressed reinforcement:  $\sigma_{sp}=0.75 \cdot 820=615$  MPa. The condition is checked. With the electro thermal tensioning method  $p=\frac{30+360}{l}=\frac{30+360}{8.4}=46$  MPa;  $\sigma_{sp}+$  $p=615+46=661<R_{sn}=840$  MPa - the condition is met. The plan and side views are shown in accordance with Figure 2.1.

#### 2.2.3 Calculation of longitudinal working reinforcement

Characteristic resistance of concrete class C30 /37 to axial compression  $f_{ck}$  = 30MPa. Partial safety factor for concrete  $\gamma_c = 1.5$ .

The design resistance of concrete to axial compression is determined by the formula 2.8 [3]:

$$f_{cd} = a_{cc} \cdot \frac{f_{ck}}{\gamma_c} \tag{9}$$

$$f_{cd} = 0.85 \cdot \frac{30}{1.5} = 17 \text{ MPa}$$

Characteristic tensile strength of working reinforcement class  $S500f_{yk} = 500$  MPa. The design tensile strength of the working reinforcement is determined by the formula 2.9 [3]:

$$f_{yd} = \frac{f_{yk}}{\gamma_s} \tag{10}$$

$$f_{yd} = \frac{500}{1.15} = 434.78 \text{ MPa}$$

A variable uniformly distributed load is applied to the slab  $q_k = 17 \text{ KN/m}$  and constant  $g_k = 2 \text{ KN /m}$ .

The design section of the slab is shown in accordance with Figure 2.2.

Effective cross-section width  $b_{eff} = 2.0$  M.

Working section height according to the formula 2.6 [3]:

$$\mathbf{d} = \mathbf{h} - c_1 \tag{11}$$

$$d = 230 - 30 = 200 \text{ mm}$$

We determine the value of the coefficient is determined by the formula 2.12

$$\alpha_{Ed} = \frac{M_{Ed}}{f_{cd} \cdot b_{eff} \cdot d^2} \le \alpha_{Eds,lim}$$
(12)

Where d - working section height

$$\alpha_{Ed} = \frac{100 \cdot 10^6}{17 \cdot 1000 \cdot 200^2} = 0.14 \le 0.372$$

According to the table. A.1. Appendix A [3] for normal concrete  $\leq$  C50/60;  $\alpha_{Ed} = 0.1 \text{ M} \sigma_{sd} = f_{yd} = 434 \text{ MPa} \rightarrow \omega = 0.14, \xi = \frac{x}{d} = 0.14. N_{Ed} = 0$ 

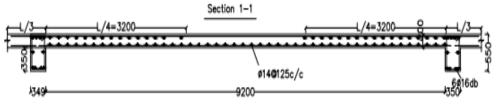

Figure 2 - Design section of the slab

The relative height of the compressed zone is determined by the formula 13[3]:

$$\mathbf{x} = \boldsymbol{\xi} \cdot \boldsymbol{d} < \boldsymbol{h}_f \tag{13}$$

 $x = 0.14 \cdot 175 = 28 \text{ mm} < 30 \text{ mm}$ 

Since the neutral axis is located within the shelf. In this regard, further calculation is carried out as a rectangular section with dimensions  $b = b_{eff} = 2000 \text{ mm}$ , d =175 mm.

Required area of tensile reinforcement according to formula 2.13 [3]:

$$A_{s1} = \omega \cdot b_{eff} \cdot \frac{d}{\frac{f_{yd}}{f_{cd}}}$$
(14)

$$A_{s1} = 0.14 \cdot 200 \cdot \frac{175}{\frac{434}{17}} = 1370 \ mm^2 = 13.7 \ cm^2$$

The area of the working reinforcement is taken according to the range of bar reinforcement is 9<sup>th</sup> rebar 14mm and the mark is S500 and placing the reinforcing is in every 200mm: (9 $\emptyset$ 14) S500 ( $A_{s1} = 13.7 \text{ cm}^2$ ).

#### 2.2.4 Calculation of transverse reinforcement

Characteristic tensile strength of transverse reinforcement class  $S500f_{y\omega} = 500$  MPa. Design tensile strength of transverse reinforcement according to the formula 15 [3]:

$$f_{y\omega d} = \frac{f_{y\omega k}}{\gamma_s} = \frac{500}{1.15} = 434 \text{ MPa}$$

The length of the section on which the transverse reinforcement must be installed according to the calculation is determined from the diagram of the shear forces.

To do this, we determine the lateral force that concrete can perceive according to the formula 16 [3]:

$$V_{Rd,c} = \left[ \left( \frac{0.18}{\gamma_c} \right) \cdot k \cdot \left( 100\rho_l \cdot f_{ck} \right)^{\frac{1}{3}} \right] \cdot b_\omega \cdot d \tag{16}$$

$$k = 1 + \sqrt{\frac{200}{d}} \le 2 \tag{17}$$

where  $f_{ck}$  -

$$k = 1 + \sqrt{\frac{200}{175}} = 2.02$$

$$\rho_l = \frac{A_{s1}}{b_{\omega}d} \le 0.02 \tag{18}$$

$$\rho_l = \frac{1370}{2000 \cdot 175} = 0.003 < 0.02$$
$$V_{Rd,c} = \left[ \left( \frac{0.18}{1.5} \right) \cdot 2 \times (100 \cdot 0.0035 \cdot 30)^{\frac{1}{3}} \right] \cdot 2000 \cdot 175 = 183.9 \text{ KN};$$
But not less  $V_{Rd,c,min}$  according to the formula 19 [3]:

$$V_{Rd,c,min} = \left[ 0.035 \cdot k^{\frac{3}{2}} \cdot f_{ck}^{\frac{1}{2}} \right] \cdot b_{\omega} \cdot d = \left[ 0.035 \cdot 2^{\frac{3}{2}} \cdot 30^{\frac{1}{2}} \right] \cdot 2000 \cdot 175 = 189.21 \text{ kN};$$

Insofar as  $V_{Ed,max} < V_{Rd,c,min}$ ; 50 KN < 183.9 kN we install transverse reinforcement based on design considerations.

The step of the transverse reinforcement is determined by the formula 20 [3]:

$$s \le 0.75d \tag{20}$$

$$s \le 0.75 \cdot 175 = 130$$
 mm

The layout of the transverse bars is shown in accordance with Figure 2.3.

The rebar's for the tensile force is the same as rebar we used in the moment part:  $9\emptyset 14S500 \ (A_{s1} = 13.7 \ cm^2).$ 

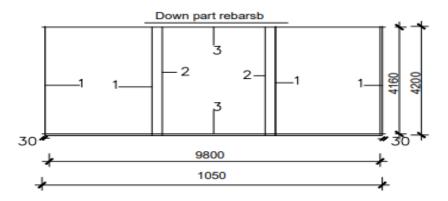

Figure 3 - slab steel design

#### 2.3 Calculation rectangular column

#### 2.3.1 Determination of longitudinal forces from design loads

Load area of the middle column with a grid of columns  $9 \cdot 4.2 = 37.8 \text{m}^2$ . Constant load:

- From overlapping according to the formula from 21 [1]:

$$N_1 = \gamma_n g \tag{21}$$

where g – constant floor load, which is equal to 2kN;

 $A_{\rm rp}$  – middle column cargo area.

$$N_1 = 0.95 \cdot 2 \cdot 37.8 = 71.82$$
 kN

- From the crossbar according to the formula from 22 [4]:

$$N_2 = \gamma_n \cdot \gamma_f h_p b_p L_p \rho \tag{22}$$

where  $\gamma_f$  – Coefficient equal to 1.1;

 $h_{\rm p}$  – Crossbar height;

 $b_{\rm p}$  – Crossbar width;

 $L_{\rm p}$  – Crossbar length;

 $\rho$  – reinforced concrete density.

$$N_2 = 0.95 \cdot 1.1 \cdot 0.6 \cdot 0.45 \cdot 27 \cdot 22 = 167.5 \text{ KN},$$

- Column dead weight according to the formula from 23 [4]:

$$N_3 = \gamma_n \gamma_f h_{\kappa} b_{\kappa} H_f \rho \tag{23}$$

where  $h_{\kappa}$  – Column section height;

 $b_{\rm p}$  – Column section width;

 $H_f$  – Floor height.

 $N_3 = 0.95 \cdot 1.1 \cdot 3 \cdot 0.45 \cdot 0.6 \cdot 22 = 18.62 \text{ kN}$ - From the coating is determined by the formula from 24 [4]:

$$N_4 = \gamma_n \gamma_f g_{\text{покр}} A_{\text{гр}} \tag{24}$$

where  $g_c$  – temporary load from the coating.

 $N_4 = \gamma_n \gamma_f g_{\text{покр}} A_{\text{гр}} = 0.95 \cdot 1.1 \cdot 1.5 \cdot 37.8 = 52.9$  кN, The total constant load is:

 $N_{total} = (167.5 + 71) \cdot 9 + 18.62 \cdot .1.2 + 52.9 = 2146 + 22.34 + 52.9 = 2221 \text{ kN}$ 

Live load:

- From the overlap is determined by the formula from 25 [4]:

$$N_5 = \gamma_n \gamma_f \vartheta A_{\rm rp} n_{cr} \tag{25}$$

where  $\vartheta$  – temporary design load

 $N_5 = 0.95 \cdot 1.1 \cdot 2 \cdot 38.7 \cdot 4 = 323 \text{KN}$ 

- From snow is determined by the formula from 26 [4]:

$$N_6 = \gamma_n \gamma_f p A_{cr} \tag{26}$$

where p - snow load

 $N_6 = 0.95 \cdot 1.1 \cdot 1.2 \cdot 38.7 = 45.9 = 46$  кN Longitudinal force acting on the column:

$$N = V_{Ed} = N_{total d} + N_{tl} = -2589 \text{ kN}$$

The moment acting on the column is take 3202KN.M from the Etabs calculation.

# 2.3.2 Selection of section and calculation of the sectional area of reinforcement

Determined by the formula:

$$\frac{c_1}{h} = \frac{c_2}{h} = \frac{4}{4o} = 0.1,$$

where  $c_1$  and  $c_2$  – column reinforcement cover; *h* - column length.

$$V_{Ed} = \frac{N_{Ed}}{(bhf_{cd})} \tag{27}$$

So as our value is more then Ned on etabs (Ned = 2589Kn, in program regarding to the reduction factor (0.9) for safety its 2827KN, it seems that we calculate it correctly as manually.

Concrete mark is C30/37, so fcd = 20 MPa for  $\alpha_{cc1} = 1.0$  $V_{Ed} = \frac{-2827000}{(450\cdot 600\cdot 20)} = -0.5$ 

$$a_{Eds} = \frac{M_{Ed}}{(bh^2 f_{cd})} = \frac{3202 \cdot 10^5}{(450 \cdot 600^2 \cdot 20)} = 0.9$$

where  $\omega_{tot} = 0.4$ 

$$A_{s,tot} = \omega_{tot} bh/\left(\frac{f_{yd}}{f_{cd}}\right)$$
(29)

$$A_{s,tot} = 0.4 \cdot 450 \cdot 600 / (\frac{434.78}{20}) = 2347 \ mm^2$$

Maximum steel area for column is 4 Celsius cross-section of column area in Etabs I find it 1 percent like  $2700mm^2$ , so we accept the bigger one 2700 and regarding this value we calculate amount of longitudinal bars

 $\frac{22^2 \cdot 3.14}{4} 4 = 379, \frac{2700}{379} = 7.12 = 8$   $A_s = 2700 mm^2$ , accept 8\,\overline{0}22 S500 ( $A_s = 2700 mm^2$ ). For the ties that are going to save the longitudinal bars we

For the ties that are going to save the longitudinal bars we use Hc/4 in two bases but in the middle we find the length by the Hc/2 (in moment area)

where *Hc* is height of the column

3/4 = 0.7 m3/2 = 1.5 mThe distance between ties is 15Dlb or a/2, a/4. In the middle:

45/2 = 22.5 cm

At the top and bottom of the column:

45/4 = 11.25 cm

## **3** Organizational and technological

#### 3.1 Removal of top soil

During pit excavation removal of top soil to be implemented at the area (only for the pit in kind of mat foundation):

$$S_1 = (10 + l_{1s,t} + 10) \cdot (10 + l_{2s,t} + 10), (m^2)$$
(30)

where,  $l_{1s,t}$ — the pit length at the top, m;  $l_{2s,t}$ — the pit top, m,

$$l_{1s.t} = l_{1s.b} + 2mh$$
 (31)

$$l_{2s.t} = l_{2s.b} + 2mh$$
 (32)

where  $l_{1s,b}$  – the pit length at the bottom;  $l_{2s,b}$  – the pit width at the bottom.

$$l_{1s,b} = l_1 + (1,3 \cdot 2), \, m \tag{33}$$

$$l_{2s,b} = l_2 + (1,3 \cdot 2), \,\mathrm{m} \tag{34}$$

where m - Slope steepness factor (Annex No 1, table 2, Euro code 2);

h - formation level (the height of the pit) per the task, m;

1.3m- distance between the axis and slope bottom, destined for a person access to the structure;

 $l_1$ ,  $l_2$ -length and width of the structure in plan, respectively (per the task), m.

$$l_{1s,b} = 129 + (1,3\cdot2) = 131.6 \text{ m}$$
  
 $l_{2s,b} = 39 + (1,3x2) = 42.2 \text{ m}$   
 $l_{1s,t} = 129 + 2 \cdot 0.5 \cdot 4 = 133$   
 $l_{2s,t} = 39 + 2 \cdot 0.5 \cdot 4 = 43$ 

$$S_1 = (10 + 131 \cdot 6 + 10) \cdot (10 + 43 + 10) = 9550.8m^2$$

The total volume of top soil removal is calculated by the formula (only for the pit):

$$V_{s,r} = S_{1(a)} \cdot 0, 15m, m3$$
 (35)

$$V_{s,r} = 9550.8 \cdot 0.15 = 1432.62 \ m^3$$

#### **3.2 Soil compaction**

Compaction volume is measured mainly by the area of compaction that can be found, given by the average value of the compacted layer thickness (for the pit):

$$v_{com} = \frac{v_{bf}}{h_c} \,\mathrm{m}^2 \tag{36}$$

where 
$$V_{bf}$$
 – backfilling volume,  $m^3$ ;  
 $h_c$  – compacted layer thickness, (0.2 to 0.4)m  
 $v_{com} = \frac{4503.93}{0.3} = 15013.12 \text{ m}^2$   
 $v_{b.f} = \frac{v_{p} - v_s}{1 + K_{rl}}$ 
(37)

where  $V_{s/f}$  volume of strip foundation,  $m^3$ ;

*V<sub>cellar</sub>*— volume of cellar.

$$V_{cellar} = l_1 \cdot l_2 \cdot h_{f(b)}, m^3$$
  
 $V_{cellar} = 129 \cdot 39 \cdot 0.3 = 1509.3, m^3$ 

where  $K_{rl}$  – Index of residual soil loosening;

 $h_{f(s)}$  the height of the structure basement, ref. mat strip foundation section.

$$v_{b.f} = \frac{9845.97 - 5.4 - 607.5}{1 + 1.05} = 4503.93$$

#### **3.3 Reinforcement installation**

Reinforcement consumption for the math and pile foundation:

$$G_1 = g \cdot V_{s/f}, t \tag{38}$$

where g – reinforcement frame consumption for  $1m^3$  of concrete, kg/ $m^3$  (100–150 kg/ $m^3$ ).

 $V_{s/f}$ - volume of strip foundation,  $m^3$ ;

$$G_1 = 130 \cdot 2.16 = 280 \tag{39}$$

$$V_{S/f} = (h_f(s) \cdot 0.3 \cdot P_{base.}) + (h_f(b) \cdot 0.8 \cdot P_{base}), m^3$$
 (40)

where  $V_{s/f}$  – volume of strip foundation,  $m^3$ ;

 $h_{f(b)}$  the height of the foundation base, ref. math foundation;  $h_{f(s)}$  the height of the structure basement, ref. math foundation ;  $P_{base}$  – total foundation length per the scheme.

$$V_{S/f} = (3.2 \cdot 0.3 4 \cdot) + (0.3 \cdot 0.8 \cdot 4) = 4.8m^3$$

Reinforcement weight distribution between grid and frame conditionally

accepted as: for the grid– $0.7G_1$ ; for the frame –  $0.3G_1$ .

$$0.7 \cdot 480 = 336$$

$$0.3 \cdot 480 = 144$$

The building height is about 27.8m from the soil level, my building foundation deptid

#### 3.4 Selection of the assembly crane

As an initial data in cranes selection serves the dimensions of pit for foundations and the basement of the structure, dimensions and weight of mounted structures.

In the cranes selection for installation of column foundations need to be used self-propelled jib cranes. When mounting the structure monolithic strip foundations with basement to be used column-tower crane.

Cranes selected by the technical parameters: load capacity, hook lifting height, working radius and the largest load moment.

Tower and jib rail cranes

When choosing the crane, it is required:

- to determine the technical capacity of crane type;
- to prepare feasibility evaluation of its use;

Initial data in this case are:

- dimensions space–planning decision of a building or structure; and
- dimensions, weight and operating position of mounted element with allowance for mounting equipment;

Mount technology work performance conditions (access roads, storages, proximity of adjacent structures and utilities, soil and climatic features, structure of the underground part, etc.) the schemes for determination of the mounting characteristics of tower cranes and jib rail cranes when mounting (a) aboveground and (b) underground structure parts.

Lifting height of crane hook  $H_r$ , m is calculated using the formula:

$$H_r, = h_1 + h_2 + h_3 + h_4 \tag{41}$$

where  $h_1$  – the height of mounted structure from the crane base (taken equal to 0), m;

 $h_2$  – the height of mounted element (1.5÷2 m);

 $h_3$  – the height from the top level of the structure to the bottom of the cargo  $(\frac{0.5}{1}m);$ 

$$h_4$$
 – the height of lifting equipment ( $\frac{2}{4.5}$ m);  
H= 0+1.75+0.75+3=5.5

In certain cases, the amount of  $h_4$  to be selected through the catalogs of lifting

equipment in relation to the mounted elements.

Crane working radius during construction of underground part  $L_u$ , m, is calculated using the formula

$$L_u = a + c + B_p + 0.5 \tag{42}$$

where, c – slope construction, m;

$$C = L_{1s.t} - l_{2s.t} \tag{42}$$

where  $l_{1s,t}$  length of a pit on top, m;

 $l_{2s,t}$ -width of a pit on top, m.

$$C = \frac{51.6 - 51.6}{2} = 0$$

where  $B_p$  – the width of structure underground part  $(l_1 + (0, 5 \cdot 2))$ , m; 0,5 – reserve zone width, m.

a – the distance from the crane rotation axis to the pit edge, m, is equal to.

$$a = \frac{b}{2} + 0.5 + r1$$

where b – width of the crane track  $(\frac{5}{7})$ , m;

0.5 - half the width of the sleeper or sleeper unit;

 $r_1$  – minimum allowable distance from the slope base to the sleeper structure, m, accepted per.

$$6/2 + 0.5 + 3 = 6.5$$

According to the basic characteristics of the directories or catalogs to be selected corresponding crane.

Required carrying capacity of the crane is calculated using the formula:

$$Q_{cr} = (q_1 + q_2) \cdot K, \dots$$
 (44)

where  $q_1$ -maximum weight of the mounted element, t;

$$q_{1}=m_{b_{1}}+m_{c_{2}}$$
 (45)

where  $m_{b_1}$ -bucket weight

$$m_{c2}$$
- concrete weight (2÷2,5) t/m<sup>3</sup>.  
 $q_1 = 0.380+2.25 = 2.63$ 

where  $q_2$ -lifting equipment and tools weight (0,1÷0,15), t;

K- factor including the deviation of lifting device weight, taken equal  $\frac{1.08}{1.12}$ .

So 
$$Q_{cr} = (2.63 + 0.125)1.1 = 3.3$$

Required working radius is determined by the formula:

$$L_{\rm cr}{}^{tr} = b/2 + a_1 + c \tag{46}$$

where, b– width of the crane way (track),  $(5 \div 7)$ , m;

 $a_1$  – the smallest admissible distance from the slope basis to the closest

support of the crane (portable, wheel, caterpillar), for tower cranes – to a sleeper design at not bulk soil;

c – the distance from the gravity center the farthest from the crane mounted element to the protruding part of the crane (taken equal to the width of the structure  $-l_2$ ) m.

$$L = \frac{6}{3} + 3 + 18 + = 24$$

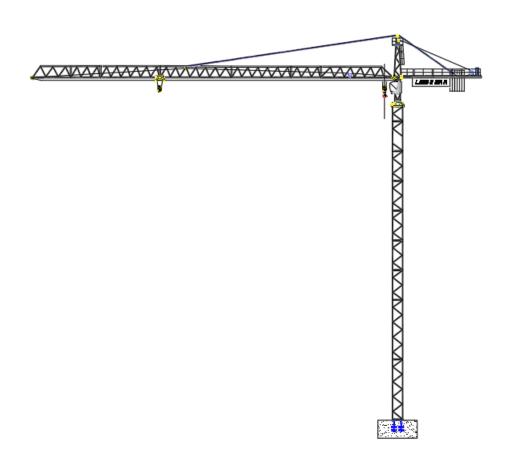

Figure 4- Tower crane

## 4 Economic

## **4.1 Estimation of building**

The estimated construction cost is the amount required, the amount required to be built

Adapts to count on reliable, high-quality content. Law of the Republic of Kazakhstan.

The basis for determining the investment value for construction, the cost of construction work is a good guide to preparing contractors.

Clients and construction services contracts and accounting as a general rule, the employment contract is in accordance with the applicable law in this law. Estimating the cost of the construction project calculate the estimated construction cost feasibility study is at the product planning stage. This section investments in buildings must be identified.

The entire investment portfolio includes: planning and certification, cost of construction equipment, cost of goods, cost of installation, etc. Considered this is a way to increase the planned capital invest in building utilities. In a combined analysis the calculation of doing something is as follows:

1) For preparatory work in the construction site;

2) The main thing of construction;

3) Restrictions for the purposes of the service.

4) Energy facilities

5) Transport and communication facilities

6) The external network, sewage and water supply.

7) Landscaping and landscaping.

8) Temporary buildings and structure

9) Additional construction costs.

10) The Headquarters Department.

11) Training

12) Research and planning activities.

#### CONCLUSION

Constructing of college firstly based on the people of that city, those who are eager to read and learn, second the master plan of educational center which is going to made in central part of the city or people can easily get in to that, like it should be spoort by transportation or like bus lines meetro station and etc.

The architectural part of the buildings is related to the climate of that region, and the data are taken out from those sourse and making the arch of building.

The constructive area of building is importnt as its place, the invironmental affects is a main factor of constructive part. The standard already chosen by the spatial codes and regarding to this standard codesd codes dwe can design our building.

The importance of universites is that helps peope to do better financially, figure out the job and having exellent life And stay strong in their organization. This gives students multiple options and allows them to decide which career path they want to take. At the time, this university seemed expensive, but over time, people's lives have improved. Times are changing and many people are trying to ignore the important benefits of university. The fact is that a good university education enables graduates to choose more jobs, which will help prepare graduates for real life and motivate people to become better citizens. The initial cost of a kidney can be violent, but it has longterm benefits. University is the best choice for those who feel good in real life.

So this college is going to be build in the Amaty Kazakhstan in the satbayev street, the college has 9<sup>th</sup> floor with the 27.8 m height from groud level and the construction is kind of monolitic rcc concrete.

In a result constructing of educational centers has many benefits here are some example of them

1) Learning skills before job

Colege allow you to get more experirnce in what do you wan to become in future, so after finishing theis degree you will easily find out jobs.

2) Internal satisfiction

Byb the attain on college you will realize a sense of inear satification. When you finish the college you are ready to take any chalinging task in the world and its really increas your confidence level.

3) Transform the world

Knowledge gives you this oppourtunity to tranformy yourself and the world around you.

#### 1 Structure Data

This chapter provides model geometry information, including items such as story levels, point coordinates, and element connectivity.

1.1 Story Data

### RESPONSE

#### **OF THE SUPERVISOR**

for the graduation project Asim Poya 5B072900 – Civil Engineering

#### Topic: «College building with the use of kinematic supports in Almaty»

Student Asim Poya completed the diploma project of the college in Almaty. The complexity of this topic lies in the seismicity of the city and the choice of the type of foundation. Unfortunately, when issuing the task for the design and construction part of the building, the columns and floor slabs were determined for the calculation of the structure. Asim P. successfully coped with this task, but the special emphasis in the name was in the kinematic supports of the building, but this section was not included in the design and construction part.

Student Asim Poya completed the diploma project at a good level. All sections of the project have been developed and calculated. Calculations of the structural section were made in accordance with the new norms of the Republic of Kazakhstan, taking into account the seismic load and the specifics of Almaty. A technological section has been developed, technical maps, a calendar plan, and a construction plan have been completed. All sections of the diploma project are completed in full.

The diploma project is completed at a good level and meets the requirements for bachelor's theses. Student Asim Poya deserves a good grade.

#### **Supervisor**

Candidate of technical sciences, assistant professor

Zhambakina Z.M.
