1. Description of educational program

Within the framework of the Master's degree specialty, the university independently develops various educational programs in accordance with the National Qualification Framework, professional standards and agreed with the Dublin descriptors and the European Qualification Framework.

Educational programs should be focused on learning outcomes.

Dublin descriptors, which are a description of the level and scope of knowledge, skills, skills and competencies acquired by undergraduates upon completion of the educational program of each level (stage) of higher and postgraduate education, are based on learning outcomes, formed competencies, as well as the total number of ECTS credit (credit) units. The structure of the Master's degree program is formed from various types of educational and scientific work that determine the content of education, and reflects their relationship, measurement and accounting.

The purpose of the educational program is to achieve the provision of highquality educational services in the field of postgraduate education, leadership in the national training space in the specialty 7M07304 "Engineering systems and networks" through the implementation of the principles of the Bologna Process and modern quality standards.

The objective of the educational program is to train highly qualified competent specialists in the construction and engineering sector of the economy of the Republic of Kazakhstan, who are able to quickly adapt to rapidly changing market conditions and innovative trends.

The list of elective component disciplines is determined by the university independently. This takes into account the expectations of employers and the needs of the labor market. Masters of the specialty 7M07304 "Engineering systems and networks" can perform the following types of professional activities:

- Settlement and design and technical and economic;

- organizational and managerial;

- production, technological and operational;

- legal, expert and consulting - research;

- educational (pedagogical).

Specific types of activities are determined by the content of the educational and professional program developed by the university. Organizational and managerial activities:

- organization of the work of the labor collective of performers with the creation of the necessary conditions, equipping (providing) production with labor and material resources, making optimal management decisions in various production conditions;

- finding optimal solutions in the event of labor disputes over staffing, wages, cost and quality of performance of various types of work, ensuring life safety, labor protection and compliance with environmental safety in production areas;

- assessment of production and non-production costs to ensure the quality of products of construction and repair production;

- implementation of technical control and quality management in transport construction.

Production, technological and operational activities:

-planning and solving technological problems encountered in the production process;

- efficient use of materials and raw materials, equipment, machinery, modern computer programs for calculations and design of technological process parameters;

- engineering and technical operation of buildings and structures of industrial and civil construction or engineering systems.

Scientific, experimental and research activities:

- implementation of fundamental and applied scientific research in the study of engineering systems;

- creation of new production technologies;

- implementation of experimental design developments;

- production of analysis of the state and dynamics of objects of activity using modern methods and methods;

- production of scientifically based experimental studies of engineering systems;

Legal, expert and consulting activities:

- possession of basic knowledge in the field of civil, financial, commercial and other branches of law;

- the ability to navigate the current legislation and the ability to apply certain legal norms in practice;

- conducting expertise and providing consulting assistance in various production situations.

Educational (pedagogical) activity:

- knowledge of the functions of teaching courses in basic disciplines, technology, organization, planning and management of engineering systems, performing academic work as a teacher (teacher) in institutions of secondary and vocational education (schools, gymnasiums, lyceums, colleges).

2. Purpose and objectives of educational program

Purpose of EP:The purpose of the educational program is to achieve the provision of high quality educational services in the field of postgraduate education, leadership in the national space for training personnel under the educational program 7M07304 "Engineering Systems and Networks" (scientific and pedagogical direction) through the implementation of the principles of the Bologna process and modern quality standards.

Tasks of EP: training of highly qualified competent specialists in the construction and engineering sector of the economy of the Republic of Kazakhstan, able to quickly adapt to rapidly changing market conditions and innovative trends.

The list of elective component disciplines is determined by the university independently. This takes into account the expectations of employers and the needs of the labor market.

3. Requirements for evaluating the educational program learning outcomes

A graduate who has mastered master's degree programs should have the following general professional competencies:

- the ability to independently acquire, comprehend, structure and use new knowledge and skills in professional activities, develop their innovative abilities;

- the ability to formulate research goals independently, establish the sequence of solving professional tasks;

the ability to apply in practice the knowledge of fundamental and applied sections of disciplines that determine the orientation (profile) of the master's degree program;
the ability to professionally choose and creatively use modern scientific and technical equipment to solve scientific and practical problems;

- the ability to critically analyze, present, defend, discuss and disseminate the results of their professional activities;

- proficiency in the preparation and execution of scientific and technical documentation, scientific reports, reviews, reports and articles;

- willingness to lead a team in the field of their professional activities, tolerantly perceiving social, ethnic, confessional and cultural differences;

- willingness to communicate orally and in writing in a foreign language to solve the tasks of professional activity.

A graduate who has mastered the master's degree program must have professional competencies corresponding to the types of professional activities that the master's degree program is focused on:

research activities:

- the ability to form diagnostic solutions to professional problems by integrating the fundamental sections of sciences and specialized knowledge obtained during the development of the master's degree program;

- the ability to independently conduct scientific experiments and research in the professional field, generalize and analyze experimental information, draw conclusions, formulate conclusions and recommendations;

- the ability to create and explore models of the studied objects based on the use of in-depth theoretical and practical knowledge in the field of engineering systems of buildings and structures;

- scientific and production activities:

- the ability to independently carry out production and scientific field, laboratory and interpretive work in solving practical problems;

- the ability to professionally operate modern field and laboratory equipment and devices in the field of the master's degree program;

- the ability to use modern methods of processing and interpreting complex information to solve production problems; - project activities:

- the ability to independently draw up and submit projects of scientific research and scientific production works;

- readiness to design complex research and scientific-production works in solving professional tasks;

- organizational and managerial activities:

- readiness to use practical skills in organizing and managing research and scientificproduction works in solving professional tasks;

- readiness for the practical use of regulatory documents in the planning and organization of scientific and production work;

- scientific and pedagogical activity:

- the ability to conduct seminars, laboratory and practical classes;

- the ability to participate in the management of scientific and educational work of students in the field of engineering systems of buildings and structures. When developing a master's degree program, all general cultural and general professional competencies, as well as professional competencies related to those types of professional activities that the master's program is focused on, are included in the set of required results of mastering the master's program.

4. Passport of educational program

		University componen	t	-		-		-			-		
1	Foreign language	The course is designed for master students of technical	5	v			v	v				v	
	(professional)	specialties for improvement and development of foreign											
		language communication skills in the professional and											
		academic spheres. The course introduces students the general											
		principles of professional and academic intercultural oral and											
		written communication using modern pedagogical											
		technologies (round table, debates, discussions, analysis of											
		professionally oriented cases, projecting).											
2	Psychology of	Psychology of management is a section of psychology that	3		v	v	v			v			
	management	studies the psychological patterns of managerial activity. The											
		main task of psychology management is the analysis of											
		psychological conditions and management features in order to											
		improve the efficiency and quality of work in the management											
		system.											
3	History and philosophy	The purpose of studying the discipline is to form	3		v			v			v		v
	of science	undergraduates' in-depth knowledge about the stages of											
		development of the history and philosophy of science, the											
		place and role of scientific knowledge, cognitive models,											
		principles and methods of scientific knowledge. Studying the											
		course allows you to reveal the connection between											
		philosophy and science, highlight the philosophical problems											
		of science and scientific cognition, the main stages of the											
		history of science, the leading concepts of philosophy of											
		science, modern problems of the development of scientific											
		and technical reality.											
4	Higher school pedagogy	The course is intended for undergraduates of the scientific and	3		v	v		v			v		
		pedagogical magistracy of all specialties. As part of the											
		course, undergraduates will master the methodological and											
		theoretical foundations of higher school pedagogy, learn how											

		to use modern pedagogical technologies, plan and organize								
		the processes of teaching and upbringing, master the								
		communicative technologies of subject-subject interaction								
		between a teacher and a student in the educational process of a university

	Component of choice	•								
15 Actual problems o	The discipline studies the actual problems of modern water	5		v		v	v		v	
modern water sup	ly supply and sewerage systems. The issues related to the									
and sewerage syst	increased requirements for natural and wastewater treatment									
	systems are being studied, as well as issues of increasing the									
	load on treatment facilities that arise due to an increase in									
	their productivity.									
16 Topical problems	of The discipline studies the actual problems of modern heat and	5		V		V	V		V	
modern heat and g	as gas supply and ventilation systems, the tasks of providing an									
supply and ventila	ion expanded outlook, the possibility of deeper improvement of									
systems	specialized issues of professional activity in the field of heat									
	and gas supply and ventilation.									
17 Start-up and adjus	ment The discipline "Commissioning and commissioning of water	5	V		V	V				V
of water supply an	d supply and sewerage facilities" studies the rules for									
sewerage facilities	commissioning and commissioning of facilities, highlights the									
	issues of monitoring the operation of facilities and their									
	technical characteristics.									
18 Rational use of he	t and The purpose of teaching the discipline is to acquire the	5	V		V		V			V
gas in construction	knowledge and practical skills necessary to understand the									
	rational use of heat and gas during construction, gas fuel									
	supply systems, ensure uninterrupted gas supply and heat									
	supply, taking into account the operation of the main and									
	auxiliary equipment, rational consumption of gas fuel based									
	on the use of modern science and technology, taking into									
	account the development prospects of the gas industry and									
	heat supply systems									
19 Systems of protect	ion of The purpose of the discipline is to study the concepts and	5		V	V				V	
water resources	principles of water use, protection of water resources, the									
	study of methods of protection of water resources, in order to									
	preserve the qualitative and quantitative composition of water									
	resources.									
20 The economy of h	eat The economy of heat and energy in heat and gas supply and	5	v	v				v		v
and energy in heat	and ventilation systems. Methods of saving heat and energy in									
gas supply and	boiler plants, heating, ventilation, air conditioning and cooling									
ventilation system	systems, the device and the principle of operation of systems									
	using solar and geothermal energy for the heat supply of									

		domestic and industrial consumers and methods for assessing									
		the effectiveness of energy-saving measures.									
21	Modern computer	In the process of studying the discipline, future specialists are	5					v	v		V
	calculations of heat	preparing to solve problems on computers of heat and gas									
	supply, gas supply and	supply and ventilation systems, taking into account the									
	ventilation systems	modern achievements of various areas. It serves as the basis									
		for preparing the undergraduate to master the elements of the									
		methodology of scientific research, contributes to the									
		development of creative thinking; organization of the optimal									
		mental activity of the future undergraduate in the field of heat									
		and gas supply and ventilation.									
22	Modern computer	In the course of studying the discipline, masters study modern	5					v	v		v
	calculations of water	computational computer programs and modeling of processes									
	supply and sewerage	and structures, in order to effectively select equipment and									
	systems	structures.									
23	Modern methods	The purpose of teaching the discipline is to form a set of	5	v					v		v
	modernization of water	knowledge and skills on the use of methods for modernizing									
	treatment facilities	water treatment facilities in the context of increasing the									
		productivity of treatment facilities associated with population									
		growth and industrial development.									
24	Adjustment and	Adjustment and reconstruction of heat supply systems. The	5	v		v				v	v
	reconstruction of heat	basic decisions on reconstruction of modern systems of a heat									
	supply systems	supply. Adjustment and operation of city and industrial									
		systems of a heat supply. Techniques of hydraulic calculations									
		of thermal networks. The thermal and pump equipment in heat									
		supply systems. Working out пьезометрических schedules									
		with pump stations. Requirements to hydraulic modes at									
		operation of systems of a heat supply. Reliability bases at									
		operation of systems of a heat supply. Hydraulic stability of									
		systems of a heat supply. Modern technologies designing of									
		installation of systems of a heat supply.									
25	Actual problems of	In the course of studying the discipline, undergraduates	5	v	v		v				v
	operation of modern	should receive information about the current state of housing									
	systems of heat supply,	and communal services; about the management of the									
	gas supply and	municipal sector of cities and settlements; about methods of									
	ventilation	reducing heat losses and monitoring the effective use of heat									
		in heat and gas supply and ventilation systems; about the rules									

	of operation of internal engineering systems and external networks								
26 Actual problems of operation of modern water supply and sewerage systems	In the process of studying the discipline, specialists solve problems in conditions of increasing regulatory requirements for purified water of water supply and sewerage systems, in order to determine effective technological parameters of system equipment and save resources in operation.	5	v		v			v	v
27 Retechnologization of wastewater treatment facilities	The purpose of the discipline is to study the issues of retechnologization of wastewater treatment plants, the latest technologies, innovative methods of wastewater treatment, as well as the acquisition of skills in the selection of improved equipment for industrial wastewater treatment.	5		v			v	V	V
28 Rational use of energy resources	The rational use of energy resources studies energy conservation (energy saving) - the implementation of legal, organizational, scientific, industrial, technical and economic measures aimed at the efficient (rational) use (and economical use) of fuel and energy resources and the involvement of renewable sources in the economic turnover.	5			v		v	v	v
